# HANC WITH GOVERNMENT

Jeppe Druedahl

## Model

We consider a *endowment* economy with heterogeneous agents.

Time is discrete and indexed by  $t$ . There is a continuum of households indexed  $i$ .

**Households.** Households are *ex ante* homogeneous, but *ex post* with respect to their productivity,  $z_{it}$ , and assets,  $a_{it-1}$ . Each period household get stochastic endowment  $z_{it}$  of consumption good, and choose consumption  $c_{it}$  subject to a no-borrowing constraint,  $a_{it} \geq 0$ . The households pay proportional taxes  $\tau_t$  and can trade in government bonds at price  $p_t^B$ . Households have *perfect foresight* wrt. to the aggregate variables,  $\{p_t^B, \tau_t\}_{t=0}^\infty$ , and solve the problem

$$\begin{aligned} v_t(z_{it}, a_{it-1}) &= \max_{c_{it}} \frac{c_{it}^{1-\sigma}}{1-\sigma} + \beta \mathbb{E}_t [v_{it+1}(z_{it+1}, a_{it})] \\ \text{s.t. } p_t^B a_{it} + c_{it} &= a_{it-1} + (1 - \tau_t) z_{it} \geq 0 \\ \log z_{it+1} &= \rho_z \log z_{it} + \psi_{it+1}, \psi_{it} \sim \mathcal{N}(\mu_\psi, \sigma_\psi), \mathbb{E}[z_{it}] = 1, \end{aligned} \tag{1}$$

where implicitly  $v_t(z_{it}, a_{it-1}) = v(z_{it}, a_{it-1}, \{p_s^B, \tau_s\}_{s=t}^\infty)$ .

We denote optimal policy functions by  $a_t^*(\beta_i, z_{it}, a_{it-1})$ , and  $c_t^*(\beta_i, z_{it}, a_{it-1})$ . The distribution of households *before* the realization of idiosyncratic shocks, i.e. over  $z_{it-1}$  and  $a_{it-1}$ , is denoted  $\underline{D}_t$ . The distribution of households *after* the realization idiosyncratic shocks, i.e. over  $z_{it}$  and  $a_{it-1}$ , is denoted  $D_t$ .

Central aggregate variables are

$$A_t^{hh} = \int a_t^*(\beta_i, z_{it}, a_{it-1}) d\mathbf{D}_t \quad (2)$$

$$= \mathbf{a}_t^{*'} \mathbf{D}_t$$

$$C_t^{hh} = \int c_t^*(\beta_i, z_{it}, a_{it-1}) d\mathbf{D}_t \quad (3)$$

$$= \mathbf{c}_t^{*'} \mathbf{D}_t,$$

To solve the model, we define the beginning-of-period value function as

$$\underline{v}_t(z_{it-1}, a_{it-1}) = \mathbb{E}_t[v_t(z_{it}, a_{it-1})], \quad (4)$$

The *envelope condition* implies

$$\underline{v}_{a,t}(z_{it-1}, a_{it-1}) = c_{it}^{-\sigma}, \quad (5)$$

The *first condition* for consumption implies

$$c_{it}^{-\sigma} = \beta \frac{\underline{v}_{a,t+1}(z_{it}, a_{it})}{p_t^B}, \quad (6)$$

**Government.** The government chooses government spending, collect taxes,  $\tau_t$ , proportional to endowments, and issues bonds, which pays 1 consumption good in the next period. The government budget constraint is

$$p_t^B B_t = B_{t-1} + G_t - \int \tau_t z_{it} d\mathbf{D}_t \quad (7)$$

Taxes are set to ensure convergence to steady state debt, as

$$\tau_t = \tau_{ss} + \eta_t + \varphi(B_{t-1} - B_{ss}) \quad (8)$$

where  $\eta_t$  is a tax-shifter.

**Market clearing.** Market clearing requires

$$\text{Bonds: } B_t = A_t^{hh} \quad (9)$$

$$\text{Goods: } C_t^{hh} + G_t = \int z_{it} d\mathbf{D}_t = 1 \quad (10)$$

**Social welfare.** Utilitarian social welfare can be calculated as the average expected discounted utility,

$$SWF_t = \sum_{t=0}^{\infty} \beta^t \int u(c_t^*(\beta_i, z_{it}, a_{it-1})) d\mathbf{D}_t = U_t^{hh}. \quad (11)$$

where  $\underline{\mathbf{D}}_0$  (and therefore  $B_{-1}$ ) is given.

In steady state this simplifies to

$$SWF_{ss} = \frac{1}{1-\beta} U_{ss}^{hh}. \quad (12)$$

## Equation system

1. Shocks:  $\mathbf{Z} = \{G\}$
2. Unknowns:  $\mathbf{U} = \{p^B\}$
3. Targets:  $\{B_t - A_t^{hh}\}$  (bond market clearing)
4. Aggregate variables:  $\mathbf{X} = \{G, p^B, \tau, A^{hh}, C^{hh}, U^{hh}, B\}$
5. Household inputs:  $\mathbf{X}_t^{hh} = \{p^B, \tau\}$
6. Household outputs:  $\mathbf{Y}_t^{hh} = \{A^{hh}, C^{hh}, U^{hh}\}$

This implies the equation system

$$\begin{aligned} H(p^B, G) = \mathbf{0} &\Leftrightarrow \\ \begin{bmatrix} B_t - A_t^{hh} \end{bmatrix} &= \begin{bmatrix} 0 \end{bmatrix}, \quad \forall t \in \{0, 1, \dots, T-1\}, \end{aligned} \tag{13}$$

where we have

$$\begin{bmatrix} \tau_t \\ B_t \end{bmatrix} = \begin{bmatrix} \tau_{ss} + \phi \frac{B_{t-1} - B_{ss}}{Y_{ss}} \\ \frac{B_{t-1} + G_t - \tau_t}{p_t^B} \end{bmatrix} \quad (\text{forwards}).$$
